Operator guide - run a node, keep your life, watch the cents compound

For the people who run the bots while working, sleeping, and living - not babysitting charts

August 20, 2026

1. Your bot, your hours back

You are the node. The node is the whole job - and the whole job is done by the machine. The bot watches every 15-minute market, buys the near-certain favorite, banks the win at 99.5 cents, and reports once a day. You do not watch charts, you do not adjust strategies, and you do not decide when to trade. The bot decides, trades, and tells you how it went.

You will not tune this system. It tunes itself: the model learns hold-rates from every resolution, and proven strategies are pushed to your node by the network. Your only job is to read the evening summary.

Figure 1 - the lane decision: real dollars today (left) vs the replay losses the cut lanes produced (right). The bot skips the losing lanes by rule.

2. What it does while you work

Every 15 minutes it scans, decides, and either trades or refuses - and the refusals matter as much as the trades. A flat tape gets refused. A dip that cannot clear fees gets refused. An LLM that disagrees with a setup gets refused. Every refusal is logged, so the bot is never guessing and never bleeding on noise. The perps dip bot runs the same discipline on crypto, paper-first.

3. Setup in 20 minutes

Step 1 - Kalshi account, login with Google, add a little cash. Confirm your state is eligible (Kalshi is not available everywhere in the US). Create an API key in account settings and save the key ID and private key file.

Step 2 - install the app or run the headless watcher:

```
node scripts/watch-headless.js
```

Step 3 - open the dashboard at <http://127.0.0.1:8788> once to see it work, then close it. You will not need it daily.

Step 4 - optional: the perps dip bot, paper mode:

```
node scripts/perps-v2-watcher.js --paper
```

Paper is the default for a reason: the bot proves every rule on simulated money before a real dollar is at risk. Flip live only when the paper record is boring.

4. Your day - one summary, real growth

At the end of the day the bot posts one summary to your channel: today P&L, win rate, prediction accuracy, per-strategy breakdown. That is the whole daily ritual. This week on paper: 59 trades, 52 wins, 7 losses, +\$1.57 - small wins, capped losses, no surprises.

Figure 2 - illustrative day-over-day growth on a small account

The first days look like cents, and that is the design, not a failure. The stake ladder waits until \$200-300 is banked as backing, and then the same wins stop being cents and start being dollars. Small is where this starts, not where it stays.

5. Your money - the ladder

Figure 3 - same edge, bigger dollars: one win at each balance level

Your balance	Stake (25%)	One win	One capped stop
\$5	\$1.25	+\$0.14	-\$0.11
\$30	\$7.50	+\$0.83	-\$0.67
\$100	\$25	+\$2.78	-\$2.22
\$200	\$50	+\$5.56	-\$4.44
\$500	\$125	+\$13.89	-\$11.11

Fees are about 0.63c per contract on entry. The bot never enters a setup that cannot clear fees three times over - the refusal is what keeps your money working instead of leaking. You never pay for a trade the bot did not take.

6. You will not adjust strategies - the network does

Strategies are pushed down from the network when they are proven; your node applies them and reports. A worker that is too busy to touch config is exactly the worker this system is built for. The model relearns from every resolution, so the bot that ran last week is measurably smarter this week - without a single manual tweak.

7. Safety, so you do not have to watch

No martingale, no revenge trading, leverage capped, a daily loss breaker that stops new entries, stops on every live position, and the final-minute hatch that caps the rare wrong call. Paper is the default; live is a deliberate switch. The bot refuses bad setups and logs every

refusal, so the system you are not watching is still the system being honest with you.

8. Resources

Resource	Where
Kalshi account	kalshi.com - login with Google; API key in account settings
Full breakdown PDF	docs/kalshiman-full-breakdown.pdf - how the engine works, all 19 chapters
This guide	docs/kalshiman-consumer-guide.pdf
Investor brief	docs/kalshiman-investor-brief.pdf - the numbers and the fleet economics
Docs repository	github.com/unaveragetechnology/kalshiman-docs
Live dashboard	http://127.0.0.1:8788 - charts, accuracy, decisions
Event watcher	<code>node scripts/watch-headless.js</code>
Perps dip bot	<code>node scripts/perps-v2-watcher.js --paper</code>
State + logs	<code>memory/headless-state.json</code> , <code>memory/perps-v2.log</code> , <code>memory/overnight-log.md</code>

You bring the account and the patience. The bot brings the edge, the discipline, and the evening summary. Cents become dollars the moment the balance is banked enough to step the stake up - and that day comes faster than it looks.
